

# Urban CO<sub>2</sub> Monitoring and Inverse Modeling for Identifying Geographical Sources and Sinks of Carbon in Shenzhen, China

**Jun Wang**

LSCE, Paris, France

October 13, 2014

# China's population dynamics (1960-2012, in billion)

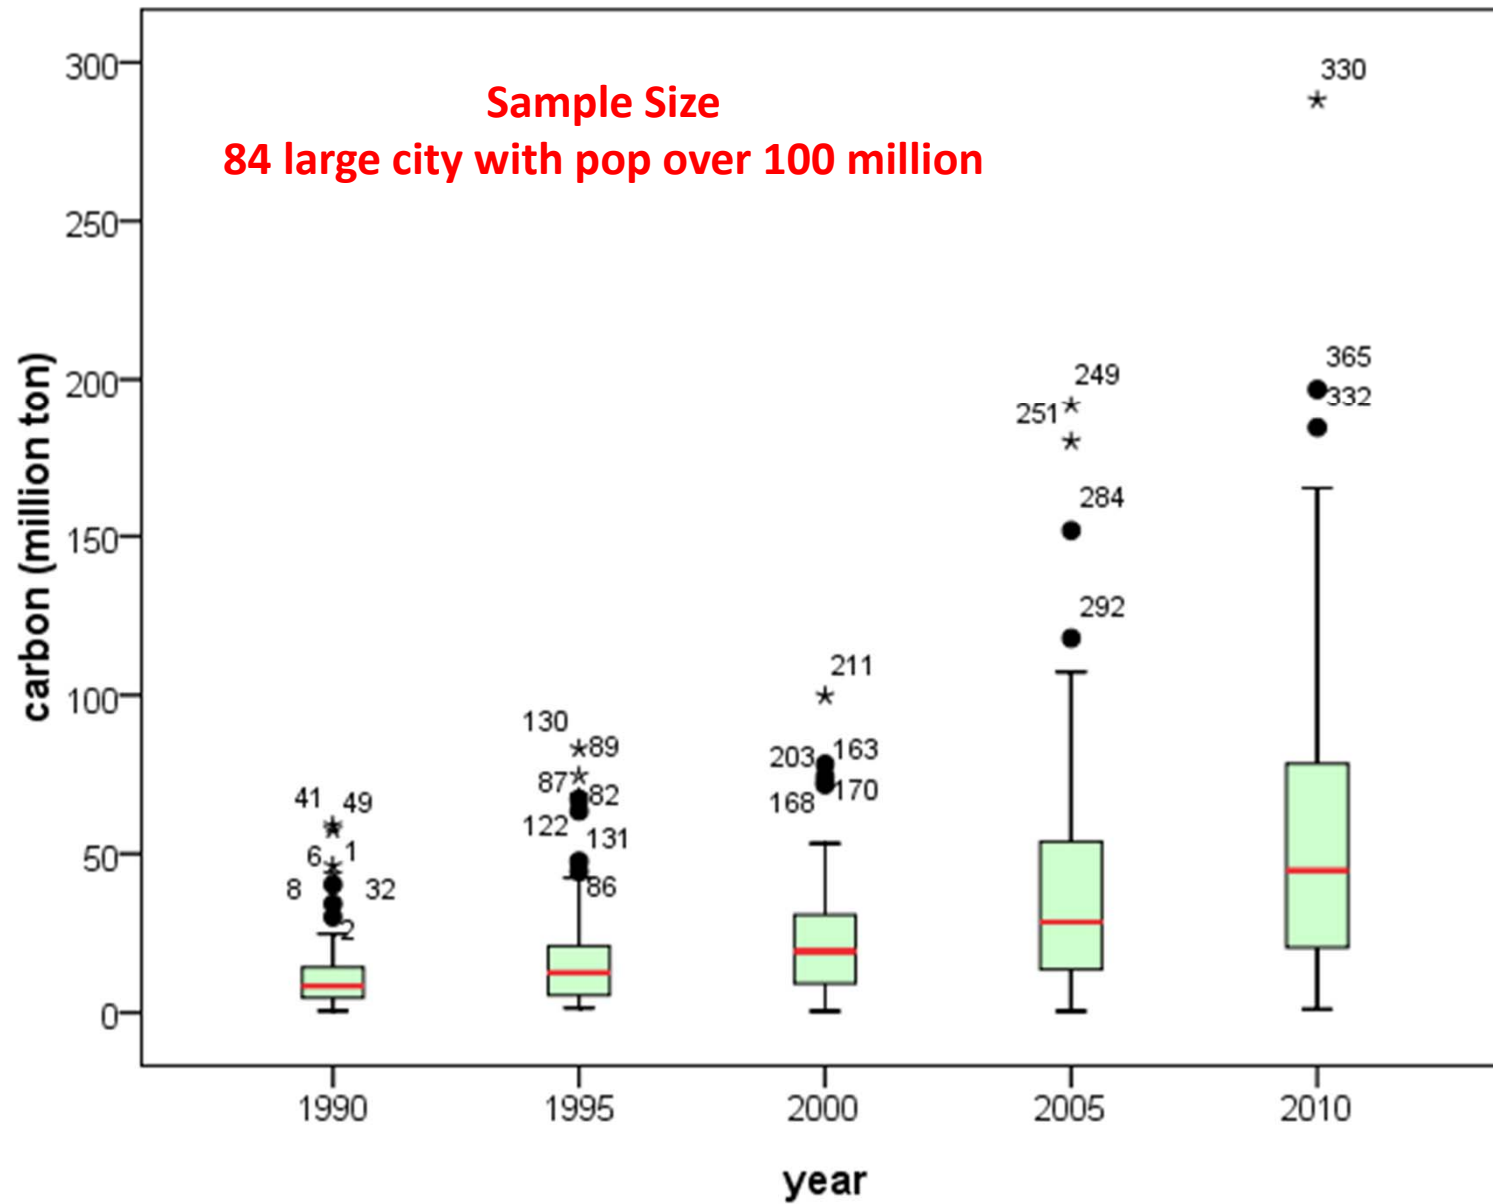

### Energy Consumption by Production

### Energy Consumption by Daily Life

Urban carbon emissions were calculated using the method of IPCC 2006 and Sup. Data

# Climate Accord Countries

COP15  
COPENHAGEN  
UN CLIMATE CHANGE CONFERENCE 2009

*The five nations that signed a deal to curb greenhouse gases produce almost half of the world's carbon dioxide emissions.*

## Carbon dioxide emissions

Global total of energy-related emissions, 2007: 28.9 billion metric tons

Source: International Energy Agency  
Graphic: Judy Treible

© 2009 MCT

*By 2020, carbon emissions per unit GDP in China will drop 40%-45%, compared with the year 2005.*

—UN Climate Conference, 2009

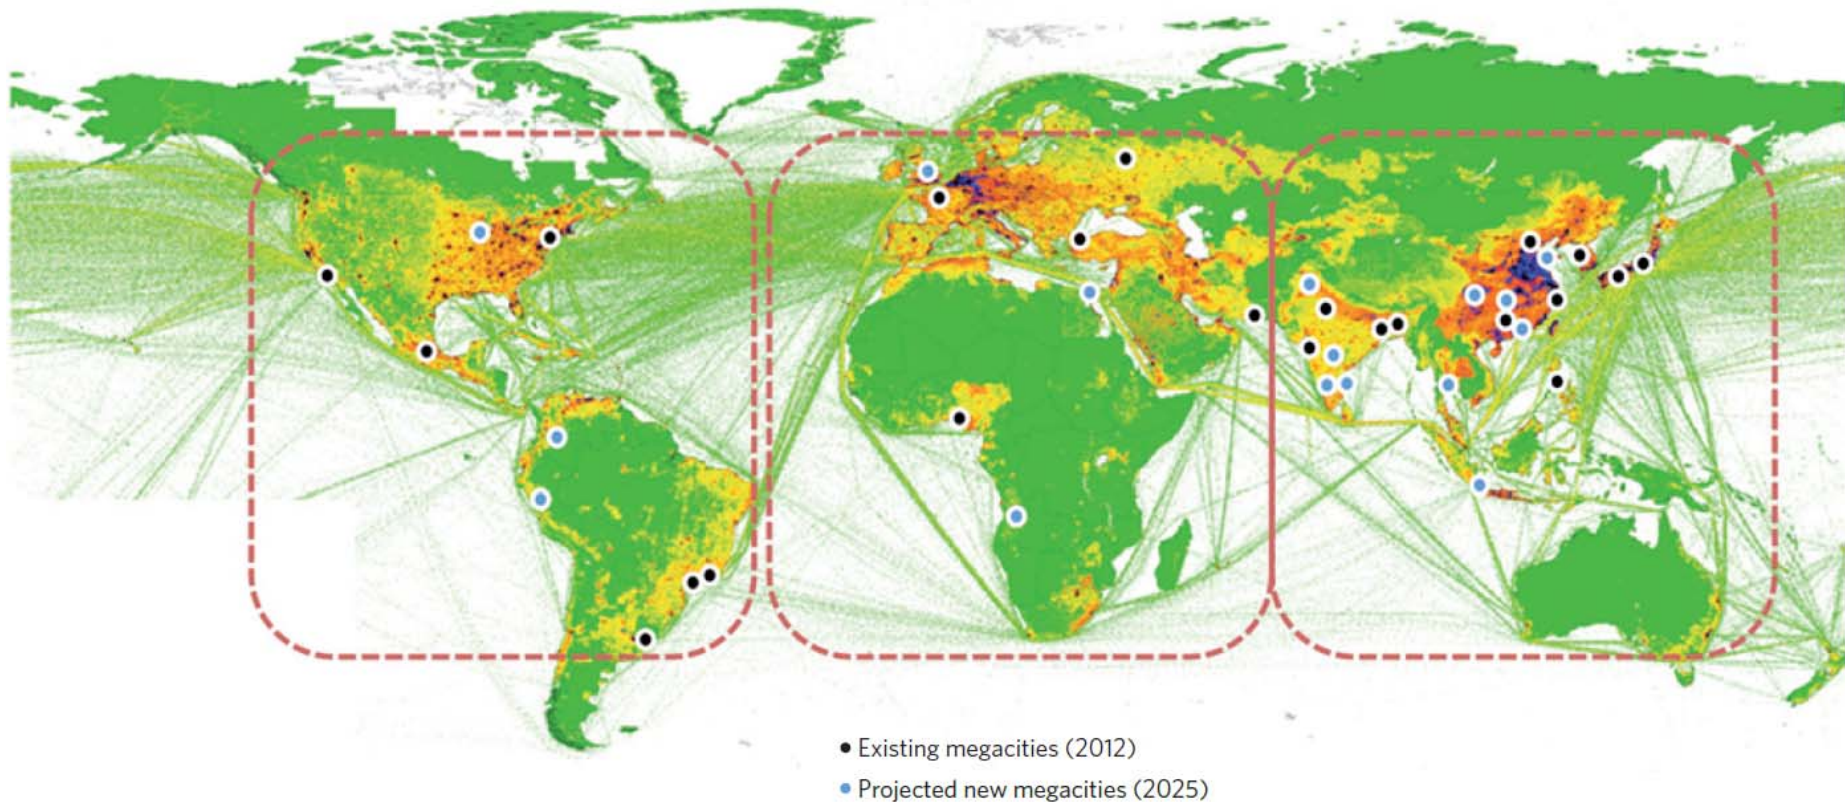

## GOVERNMENT TARGETS

Main indicators and numerical targets in **China's National New-type Urbanization Plan.**

Indicator	2012	2020
<b>Urbanization level</b>		
Urbanization ratio (resident population) (%)	52.6	60
<b>Public services</b>		
Proportion of peasant worker's children accompanying parents receiving mandatory education (%)		≥99
Basic social-security coverage for urban and township resident population (%)*	66.9	≥90
Basic medical insurance coverage for urban and township resident population (%)	95	98
<b>Infrastructure</b>		
Public transportation share in total motorized travel in cities with more than 1 million people (%)	45†	60
Public water supply coverage in cities and towns (%)	81.7	90
Proportion of wastewater treated in cities (%)	87.3	95
Proportion of municipal waste decontaminated in cities (%)	84.8	95
Broadband Internet connection capacity of urban households (megabits per second)	4	≥50
<b>Resource and environment</b>		
Per capita urban land use (square metres)		≤100‡
Share of renewable energy consumption in cities and towns (%)	8.7	13
Share of 'green' buildings in new constructions in cities and towns (%)	2	50
Share of prefecture and above level cities that meet the national air-quality meeting standards (%)	40.9	60

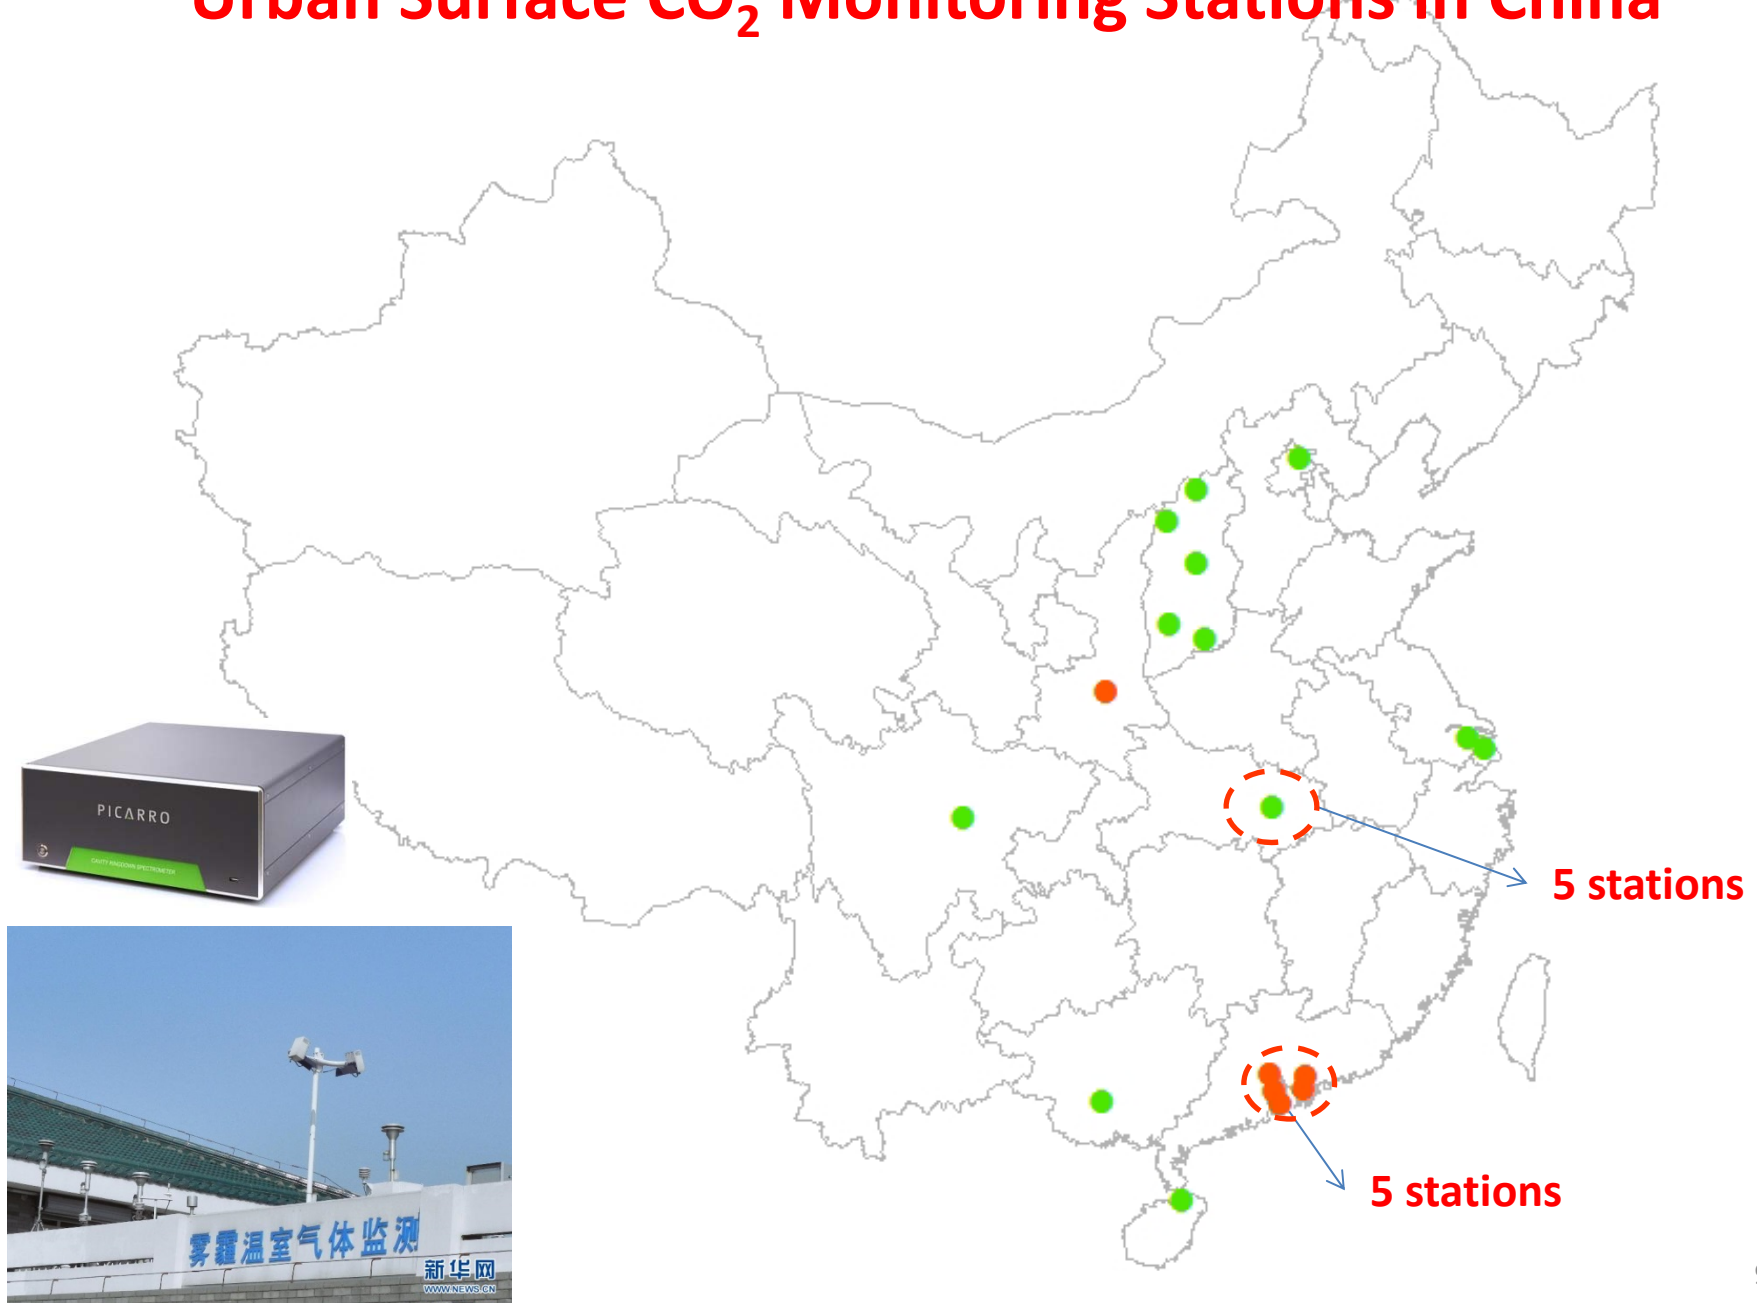

# Measuring the Carbon Emissions of Megacities

---

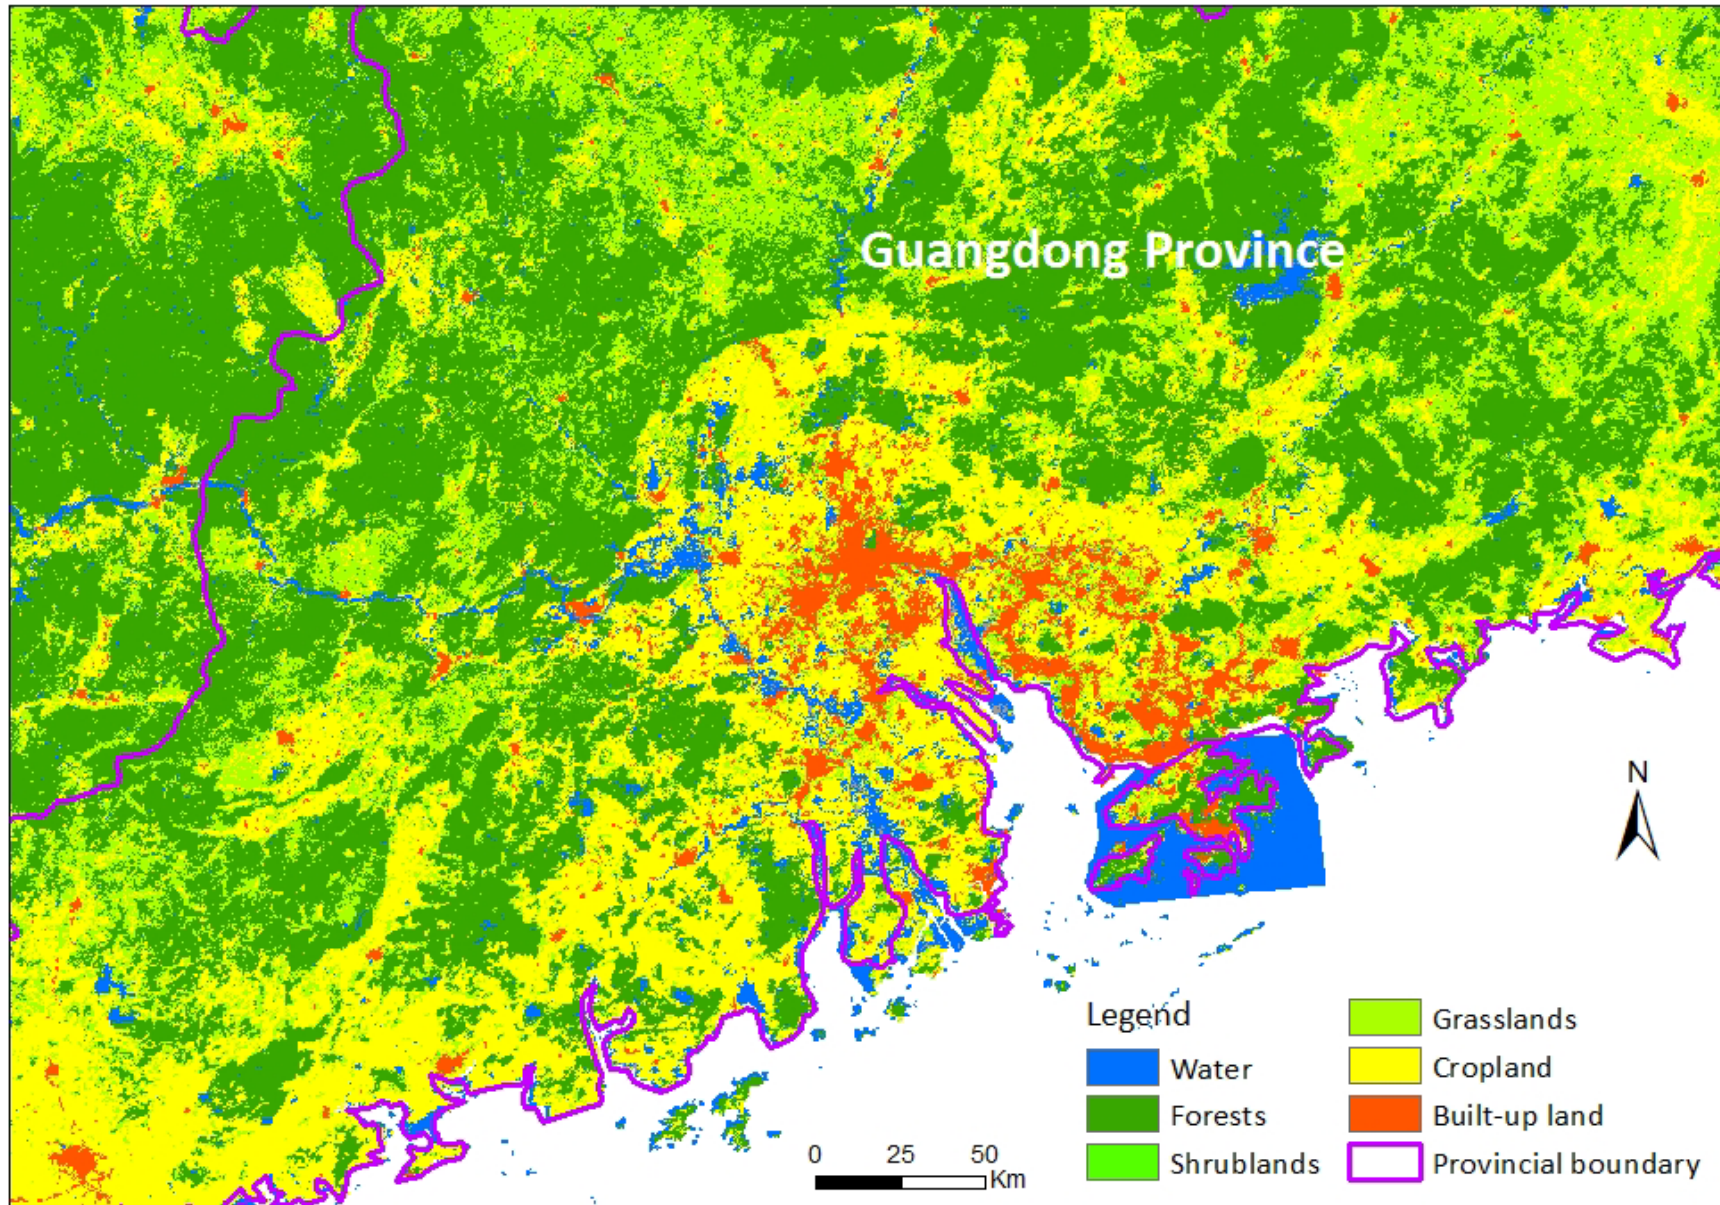

# Urban Surface CO<sub>2</sub> Monitoring Stations in China

Shenzhen

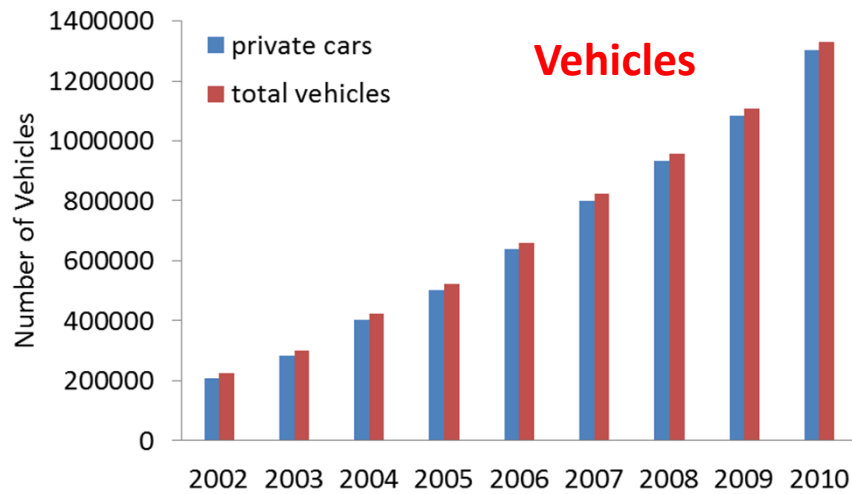

Data Source: MODIS Land Cover 2012 (MCD12Q1)

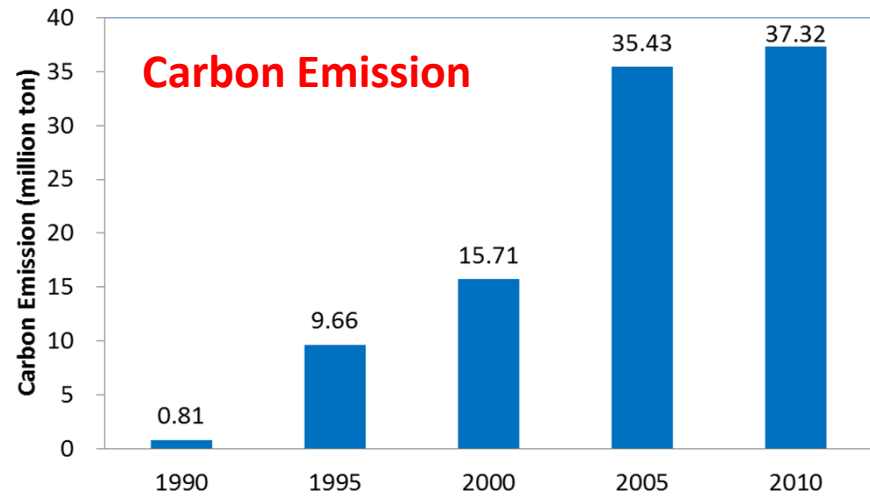

1992 -2010: pop increased about 7.7 million.

1992-2010: GDP per capita increased 7.4 times.

2002-2010, vehicle num increased 7 times.

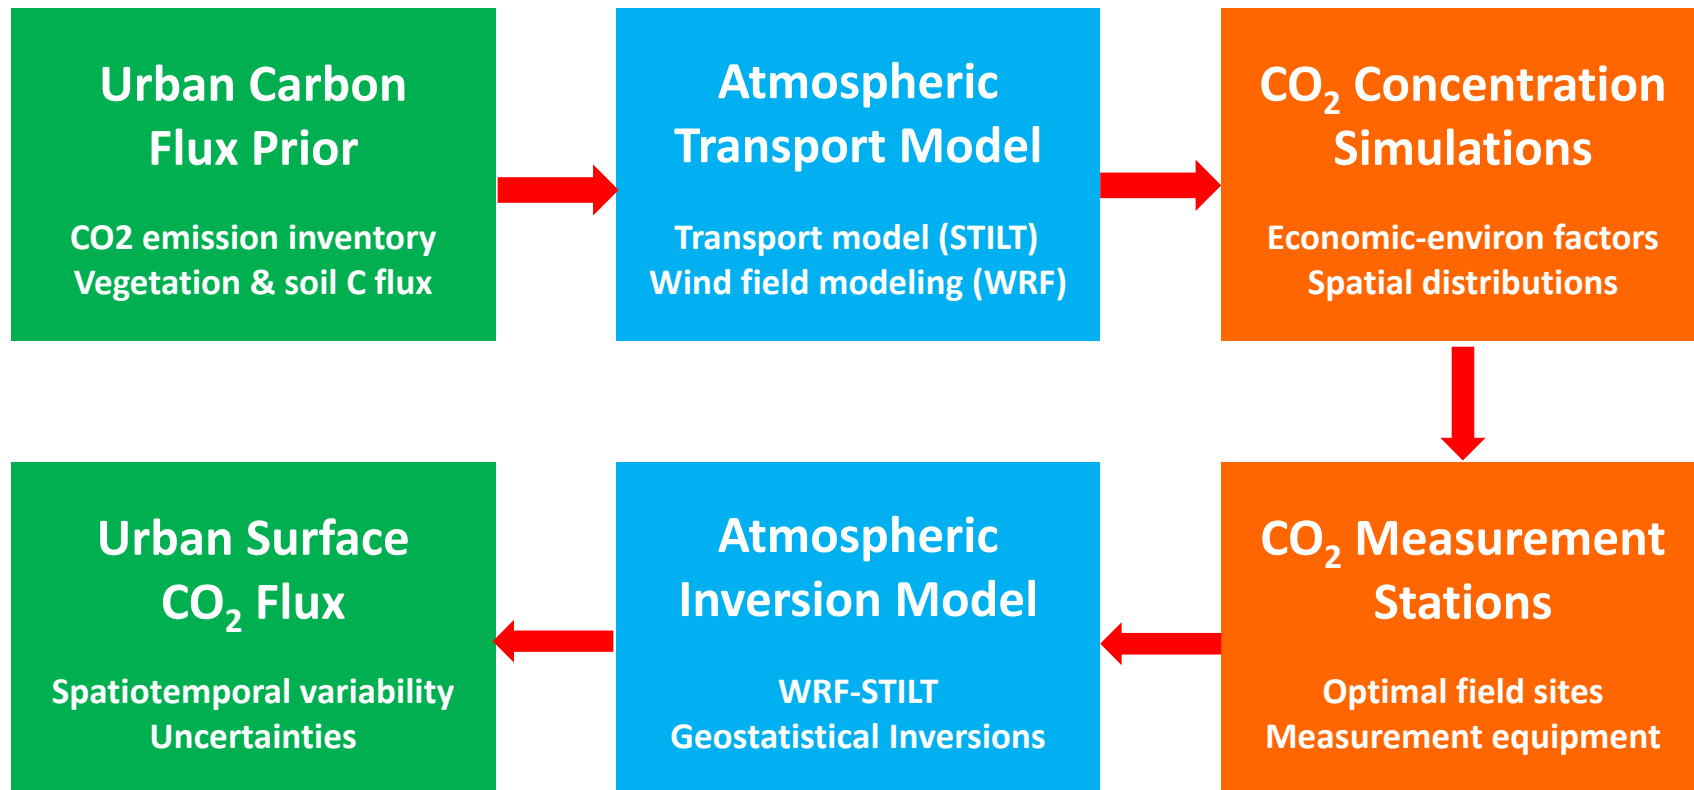

2002-2010, carbon emission increased 46 times.

### 环境空气质量

**2014年10月04日**

监测点位	AQI	级别	首要污染物
华侨城	61	二级	臭氧
南油	69	二级	臭氧
盐田	68	二级	臭氧
龙岗	70	二级	臭氧
西乡	69	二级	二氧化氮

预测04日夜间至05日之间我市空气质量指数AQI值为45~85, PM<sub>2.5</sub>日均值为28微克/立方米左右。

# Urban CO<sub>2</sub> Monitoring: Accurate & Cheap Sensors

# Bayesian Inference Applied to Inverse Modeling for Earth Surface CO<sub>2</sub> Flux Estimation

---

# Bayesian vs. Geostatistical Inverse Modeling

---

- **Classical Bayesian inverse modeling objective function**

$$L = \frac{1}{2}(\mathbf{y} - \mathbf{H}\mathbf{s})^T \mathbf{R}^{-1}(\mathbf{y} - \mathbf{H}\mathbf{s}) + \frac{1}{2}(\mathbf{s} - \mathbf{s}_p)^T \mathbf{Q}^{-1}(\mathbf{s} - \mathbf{s}_p)$$

- $\mathbf{Q}$  and  $\mathbf{R}$  are diagonal
- $\mathbf{s}_p$  is prior flux estimate in each region

- **Geostatistical inverse modeling objective function**

$$L = \frac{1}{2}(\mathbf{y} - \mathbf{H}\mathbf{s})^T \mathbf{R}^{-1}(\mathbf{y} - \mathbf{H}\mathbf{s}) + \frac{1}{2}(\mathbf{s} - \mathbf{X}\boldsymbol{\beta})^T \mathbf{Q}^{-1}(\mathbf{s} - \mathbf{X}\boldsymbol{\beta})$$

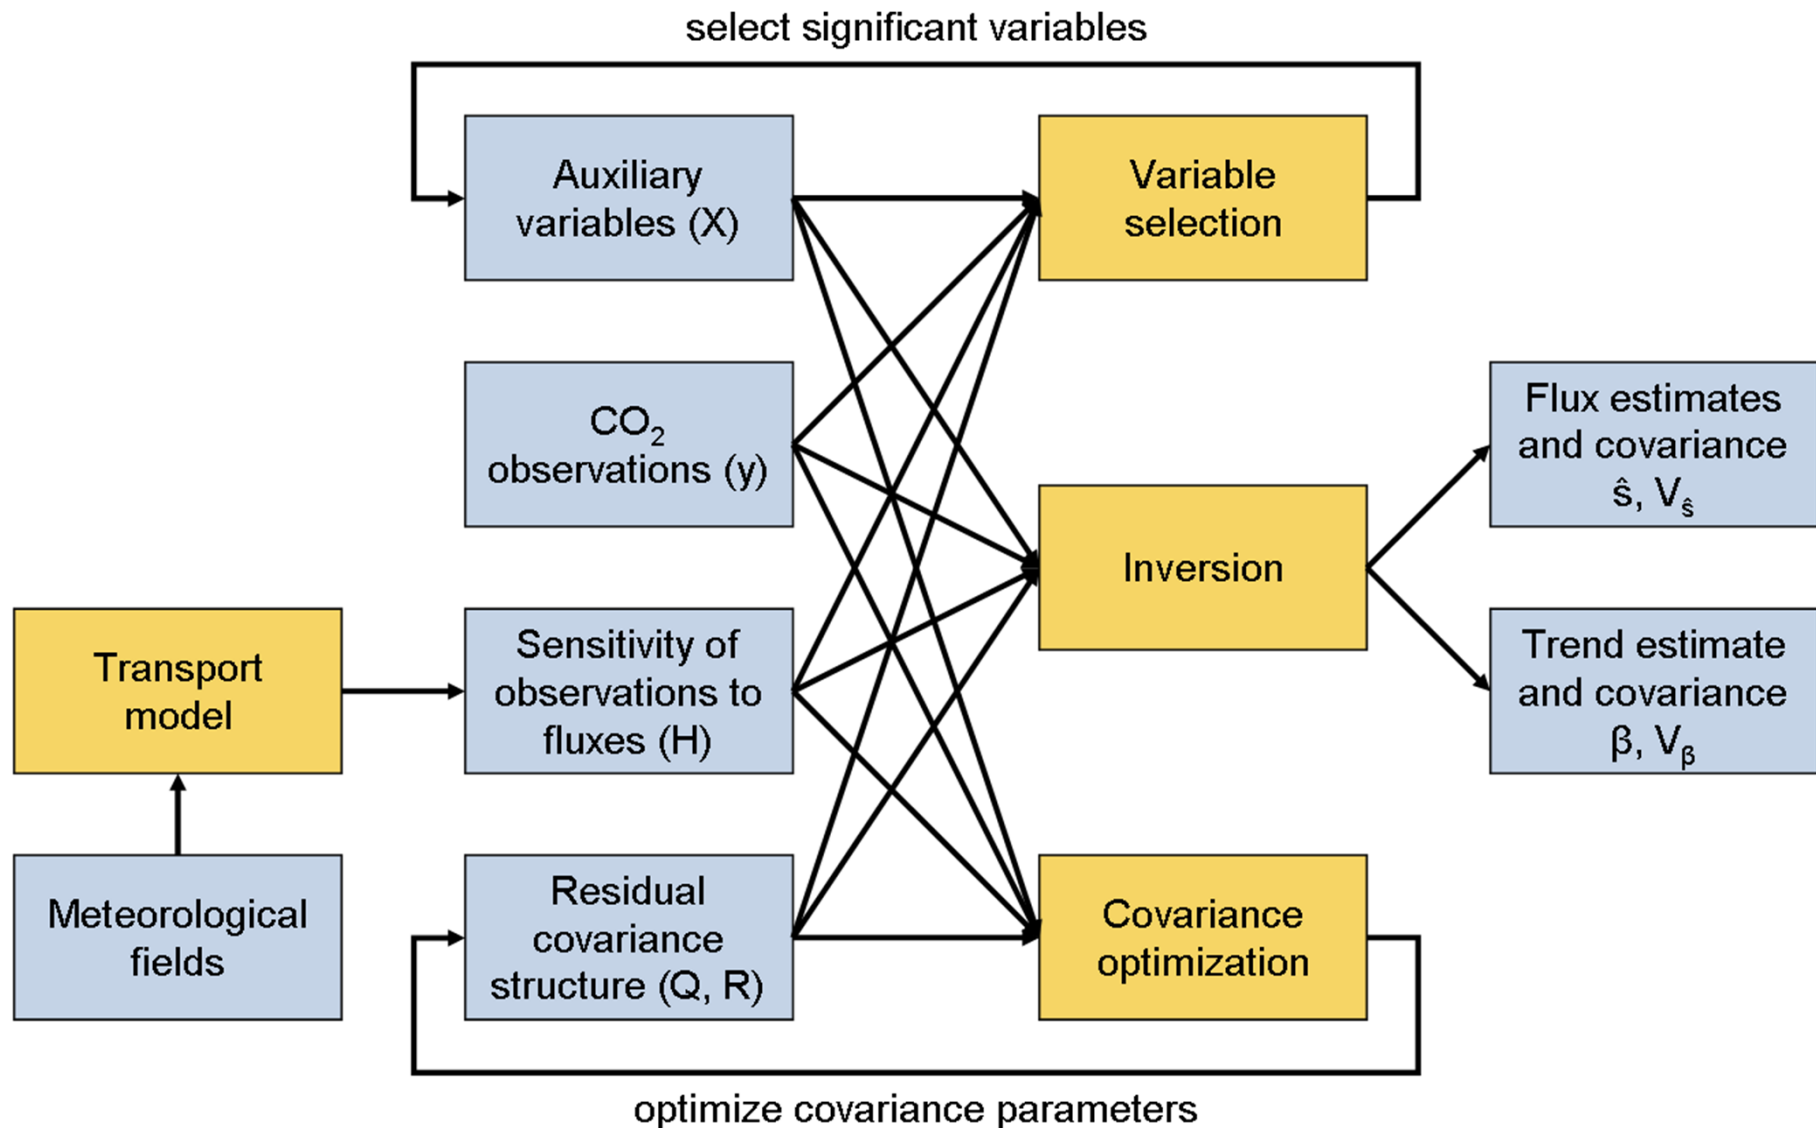

- $\mathbf{R}$  is diagonal;  $\mathbf{Q}$  is full covariance matrix
- $\mathbf{X}$  and  $\boldsymbol{\beta}$  define the model of the mean

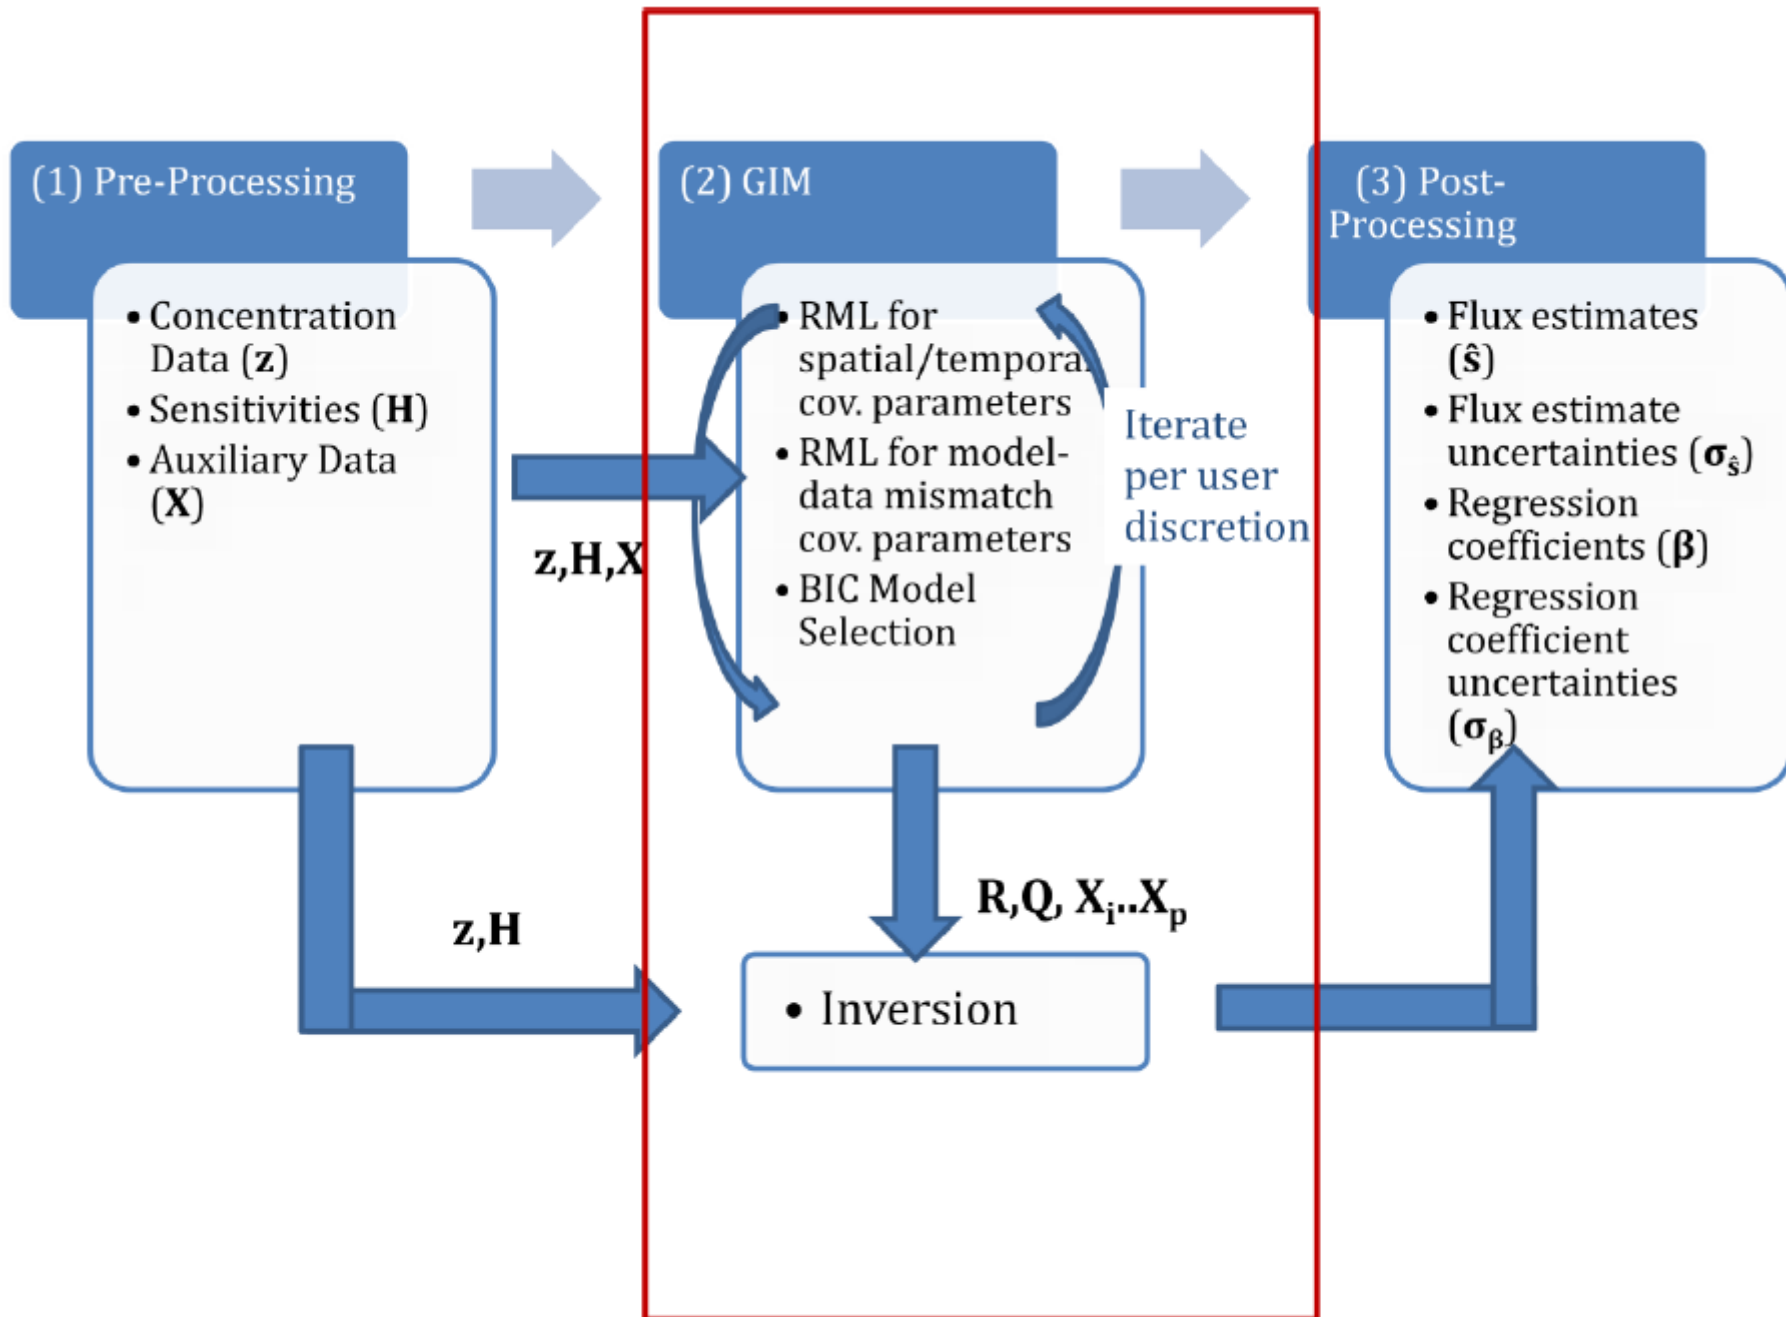

# Geostatistical Approach to Inverse Modeling

---

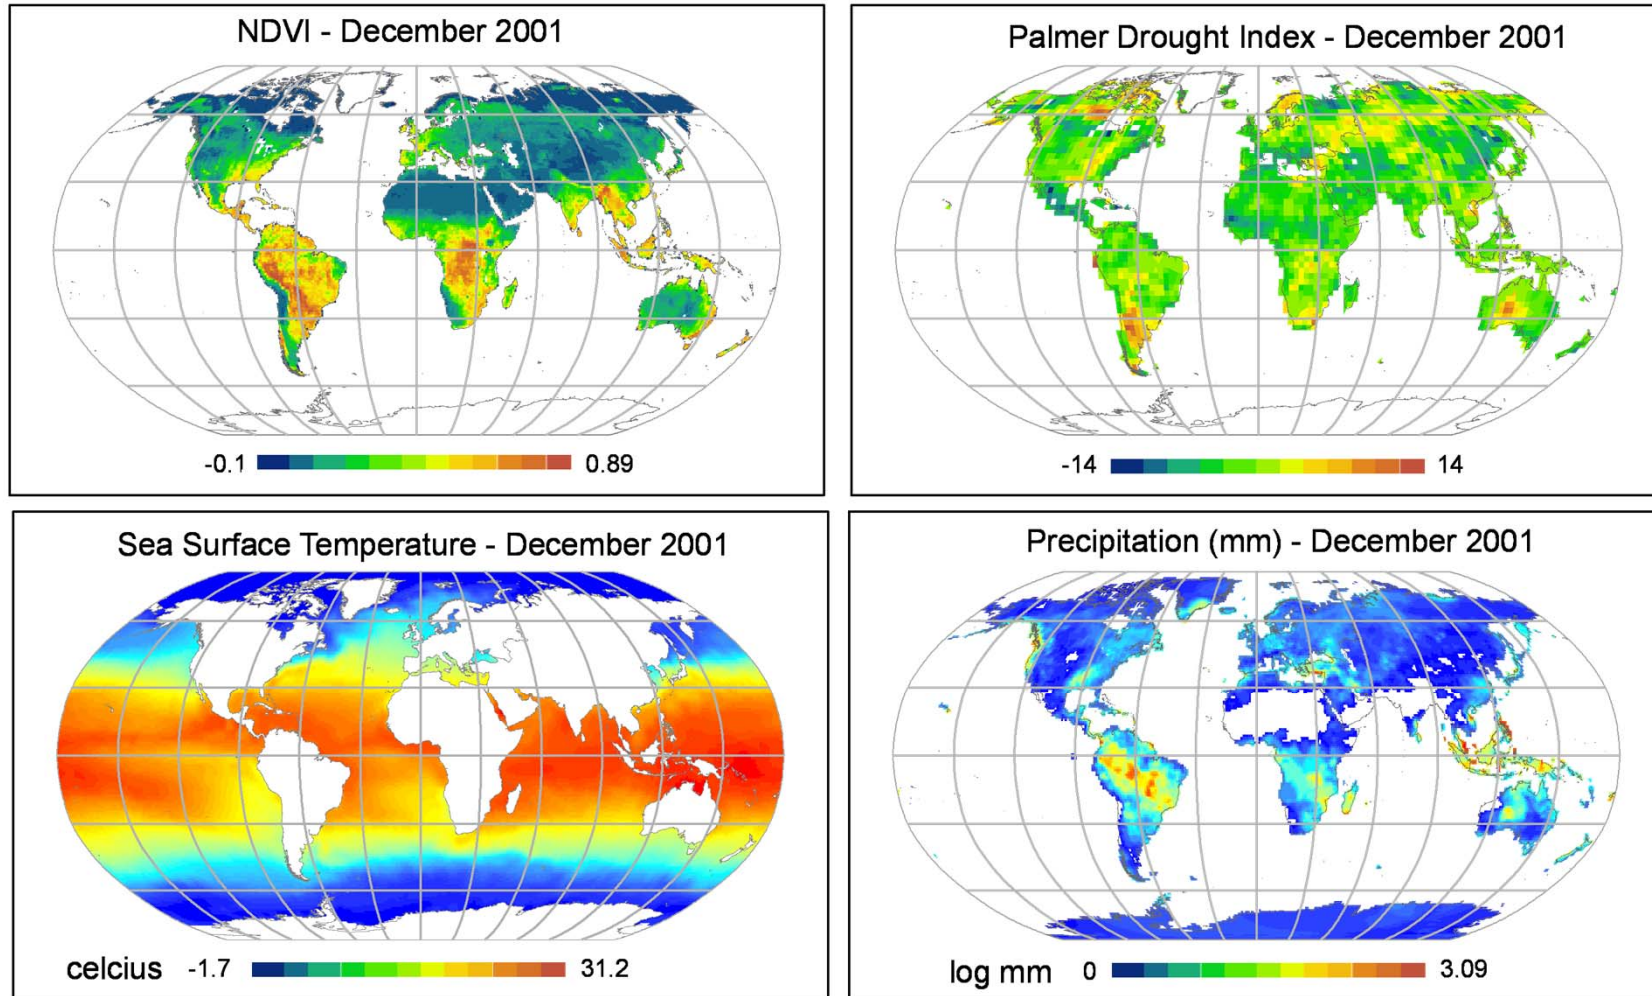

- **Prior flux estimates are not required**
- **Key components**
  - Model of the mean
  - Prior covariance matrix
- **Prior based on spatial and/or temporal correlation**
  - Derived from available data
- **Covariance parameter optimization (RML)**
  - Model-data mismatch and prior covariance
- **Method yields physically reasonable estimates (and uncertainties) at any resolution**
- **Conditional realizations can be generated**

# The Framework of Geostatistical Inverse Modeling

**Auxiliary Information can be Included in GIM to improve inversion results.**

**Some others such as GDP density, pop density, LAI, FPAR .....**
