# How to Convert IVI2 into Aerosol Optical Depth and Total Solar Irradiance 

Chaochao Gao and Alan Robock<br>Department of Environmental Sciences<br>Rutgers University<br>New Brunswick, NJ 08901 USA<br>chaogao08@gmail.com, robock@envsci.rutgers.edu

December 6, 2009

Users may convert the stratospheric aerosol loadings (in units of Tg ) provided in the Ice Core Volcanic Index 2 [IVI2; Gao et al., 2008] into aerosol optical depth (AOD) by dividing the loadings by 150 Tg [Stothers, 1984]. The AOD time series can then be used to calculate the corresponding radiative forcing (in unit of $\mathrm{W} \mathrm{m}^{-2}$ ) by multiplying it by -20 [Wigley et al., 2005]. The conversion to AOD is valid for aerosols with effective radius in the visible spectral range.

Here is a sample MATLAB code to calculate the vertical integrated AOD and radiative forcing using IVI2 monthly and spatially dependent data.

```
\%Read in the data (Note: the delimiter is blank space)
    D = dlmread ('filename',’’t');
    TIME = D(:,1);
    DATA = D(:, 2:end);
\% Calculate the vertical integrated aerosol loading
    for \(\mathrm{t}=1: 18000\)
        for \(\mathrm{i}=1\) : 18
    for \(\mathrm{j}=1: 43\)
```

$\operatorname{LOAD}(\mathrm{t}, \mathrm{i}, \mathrm{j})=\operatorname{DATA}\left(\mathrm{t}, 43^{*}(\mathrm{i}-1)+\mathrm{j}\right) ;$
end
$\operatorname{COLUMNLOAD}(\mathrm{t}, \mathrm{i})=\operatorname{sum}(\operatorname{LOAD}(\mathrm{t}, \mathrm{i},:))$; end
end
\% Calculate the vertical integrated AOD and radiative forcing AOD = COLUMNLOAD / 150; F = AOD * -20;
\% Write the output
\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%\%
